May, June and July, when the nights are cold, the natives sleep late and the camp is not active until well after daylight. As the people wake, they blow or fan the embers which have been smouldering through the night, and sit around the fire while they prepare for the day's hunting. No regular meal is eaten in the morning, but if any food remains over from the previous night they will warm this on the fire and eat it, before setting out.

About sunrise the camp is in full activity and the people now begin to move off. If each family is hunting as a separate unit the man picks up his spear-thrower and his bundle of spears—chiefly hunting weapons, with a fighting spear or two—and slings over his shoulder a small, closely-woven basket of the type called *bäti mindir*. In this he carries a bundle of firesticks, and odds and ends of half-prepared string (*räkki*) in the form known as *daiyarrk* (bast fibre), together with pieces of beeswax and resin—material used for repairing spears—a knife, or scrapers of shell, a spear head or two, and generally his smoking pipe. If there is a young child, the burden of carrying it is shared by both parents. Very young babies are carried by mothers in elongated bark troughs of the same type as those used for carrying water. These are slung over the left shoulder and supported by the arm, leaving the right arm free to use the digging stick or yam stick. Frequently an older child is carried by the father astride his neck or shoulders, and from time to time the parents change over and relieve one another. Still older children follow behind, or run alongside, sharing the hunting activities of their parents and imitating them in the search for food, learning in this way the technique of hunting and gathering food which they will use throughout their lives.

237 nificance and *must* be accumulated by the hunter.[15] This
778 fat, as well as the feathers of the birds mentioned above, are known as *tjärnbin* and play an important part in the ceremonies called *kunabibbi* and *ŋulmark*. The long bones, bills and some of the flight feathers of these birds are also accumulated and wrapped with paperbark into neat parcels called *täbarr*.

264 About midday, or at the conclusion of a drive for game
512 or fish, the people look for a suitable place to make a fire and to cook such small game as opossums, bandicoots, native cats, "goanna" or fish, as they may have secured. If they are hungry, some vegetable food may also be cooked, but the principal meal of the day is eaten in the evening
461 after the return to camp. For a couple of hours during the
512 heat of the day the natives rest. But they are rarely idle; even during these halts the men may often be seen squatting before little fires, making or repairing spears or other weapons. The women also take advantage of such respites to work at the string or mesh baskets which they carry rolled up in a half finished state, just as a white woman may take up knitting or other handiwork in moments of leisure.

[777] [15] Failure to do this would bring "bad luck", a ritual visitation, upon the hunter or on the people. The *tjärnbin*, the name given to the fat and also to certain of the feathers of the mammals and birds which have been mentioned, is believed to carry, in concentrated form, the *marr* or "spiritual power" of the animals. To waste this
[753] *tjärnbin* is to risk a ritual visitation, and if it is held for very long there is a too great concentration of *marr* so that the people will
[751] become sick. To dispel this *marr*, to avert the danger of sickness from it, a ceremony called *kunabibbi* must be held in which the fat and the feathers which are called *tjärnbin* are used and the danger
[777] is averted. It may be noted also that failure to cook game which has been killed, such as the flesh of one of the kangaroos, will bring "bad luck" and impair the *tjämbait*, the prowess or "good luck" of the hunter.

disease, scarcity of food compels the occupants to look for fresh sites. 364

Well-defined tracks link food-gathering areas and meander in or around jungles and along swamps and creeks wherever there is good hunting. Accompanied by a couple of aboriginal families and a few boys, I followed one of these tracks for about forty miles to where a distant horde had migrated. Men went ahead with their spears, and the women followed with young children, family possessions, and food-gathering dilly-bags. Every little while there was an outbreak of squealing from the women and yelping from the dogs, as a bush rat or other animal was dragged from a hollow log or tree. Occasionally a woman darted off from the track and some miles farther on rejoined the party with a bundle of edible roots or yams. 487 484 [224] [222]

By sundown we left the bush and came out on a sandy beach on the northern shores of Port Bradshaw, and men and boys were soon lying on the sand waiting for the women to prepare the camps, dig in the sand for fresh water, and cook the shellfish. Once the food was ready, the women took it to their husbands, who shared it with unmarried companions. Darkness comes quickly in the north, and married men settled down with their wives and children around their separate family fires, whilst the unattached males discreetly camped some distance away. Unmarried men always separate themselves from family groups, and any visiting males temporarily without wives stay with the bachelors. Not infrequently married men determine where the bachelors' camp is to be made, and with vivid memories of their own youthful and indiscriminate ways, rigorously enforce this segregation. In the bush, ever-courteous nomads reserved a place for me beside the young men's fire, but never anywhere near a family group, although the youths have sometimes been strangers and the married families well known to me. 765 horde had for the deceased. In decimated hordes, and in the case of aged and unwanted wives, I have known bodies to be left in the ground and no attempt made to remove them.

775 Until bones have been collected and a mother is
783 'purified' she remains smeared with red-ochre and leads an
765 inactive life. Relatives feed her and carry water from the
[302] well so that she will not desecrate it, for her child's ghost hovers near her and may attach itself to anything she handles. Similarly the relative who dismembers the body is tabu because of the ghost lodging in his skin, and he also is barred from waterholes and from feeding himself and becomes dependent on the hospitality of the family of the corpse. They are expected to treat him well even to the extent of
[431] making presents in return for the favour he has done them in attending to the corpse and running the risk of absorbing the ghost. Consequently there is no difficulty in getting 'grandsons' to run these risks, and the father not infrequently declines several offers and even limits the number of morticians to two or three.

783 This final purification ceremony is similar to the 'mum-
765 bakuta' described in Chapter 5. Food is deposited in a
[264] totemic well conveniently scooped in the sand, and from this a ceremonial meal is eaten by the victims of the tabu and by certain near relatives. Waste food is piled into the well and burnt, to prevent dingoes disturbing it, and the tabu is finally lifted and the ghost removed when the relatives heat leafy twigs in a fire and switch their bodies. Alternatively, water or sand may be poured over the 'unclean' as they stand in the totemic well and smear themselves with red-ochre.

761 All deaths are regarded with a certain amount of suspicion,
754 but the death of an active warrior is always attributed to sorcery. In such case the body is left in the ground for a very
765 short time before the bones are collected. Smaller ones are
[266]
